# BharatNet Project Management

Comprehensive Platform Overview

## Executive Overview

In today's fast-paced digital world, building robust infrastructure requires more than just manpower—it demands intelligent, data-driven systems. Our Project Management Platform is explicitly engineered for massive-scale connectivity projects, providing a unified ecosystem where planning, execution, and billing converge seamlessly.

By digitizing the entire workflow, we eliminate silos, minimize delays, and offer an unprecedented level of transparency to administrators, project managers, and on-ground field engineers.

## Core Modules & Capabilities

### 1. Planning & Management

The Planning dashboard provides critical metrics such as Planned vs. Executed routes, estimated Bill of Quantities (BOQ), and state-level deployment targets. Before the first trench is dug, our platform ensures accurate plotting of fiber routes and component requirements, allowing for optimized pathfinding and cost estimation.

### 2. Inventory & Warehouse Management

Gain real-time visibility into warehouse stock levels across multiple locations. The system automatically triggers low-stock alerts, tracks dispatch logs, and manages material inwards. Avoid stockouts and track materials from the warehouse directly to the deployment site with full transparency.

### 3. Procurement & Vendor Management

Handling large-scale projects involves managing numerous contractors and vendors. This module automates the entire procurement lifecycle. Seamlessly track Purchase Orders, vendor registrations, material deliveries, and vendor invoices directly through the portal.

### 4. Field Execution & Tracking

Equip your ground staff with mobile-friendly tracking tools. Field teams can update daily progress, upload geotagged site photographs, and flag blockages instantly. This ensures the command center is always synchronized with field realities, reducing reporting lag from weeks to seconds.

## Advanced Operational Workflows

### 5. Billing & Reconciliation

Automate your financial lifecycle. The Billing module automatically generates invoices based on verified field completion metrics and tracks payment milestones. Payment approvals are strictly tied to SLA achievements, ensuring budget utilization remains fully transparent.

### 6. Logistics

Keep a close eye on the movement of goods. The logistics dashboard connects warehouse dispatches with field receipts, tracking vehicle dispatch routes, expected delivery times, and material condition upon arrival.

### 7. Management Portal & Executive Dashboard

Decision-making is driven by data. The Management Portal aggregates inputs from hundreds of sites to present a cohesive, bird's-eye view of project health, financial utilization, and timeline adherence. It includes custom report generation and high-level KPI tracking.

### 8. Enterprise Security & Access Control

Built with enterprise-grade architecture, the platform ensures that project data remains secure and compliant. It features strictly enforced role-based access control (RBAC), meaning every user—from field engineer to state admin—only has access to the data necessary for their role.

## Ready to Transform Your Workflow?

Empower your teams with the ultimate toolset for executing digital connectivity initiatives. Gain the visibility you need to deliver projects on time and under budget.
